

SUBSTITUTE SPECIFICATION

ABSTRACT OF THE DISCLOSURE

In a method for administration of at least one data object of a printer or copier, at least data of a data object are stored in a databank, and an identifier is associated with the data object. At least one first source code with a plurality of instructions is created in a programming language, the source code containing the identifier of the data object. From the first source code, a second source code is generated, the identifier of the data object being replaced by at least one part of the data stored in the databank regarding the data object.
